The Central Utah Water Conservancy District (District) is seeking students studying civil engineering, chemical engineering, construction management, and other related fields for internship positions at its Orem office. The District manages and maintains billions of dollars of water related infrastructure including dams, tunnels, pipelines, structures, water treatment plants, and hydroelectric facilities which are used to deliver both treated and raw water. These internships involve a variety of tasks: collecting information (e.g., locations, attributes, and media) for District infrastructure; reviewing record drawings and construction materials in order to gather information necessary to facilitate cost estimating; working with GIS analysts to improve geographic accuracy on District assets; populating asset and cost databases; job shadowing field operators in order to write technical operation and maintenance documents; project/facility inspections; project documentation; researching technical topics and writing reports; assisting a project engineer with project management responsibilities; and other duties as assigned. Interested students should fill out an online application at [https://cuwcd.com/business.htm#employment](https://cuwcd.com/business.htm#employment) by February 28th, 2020. The District is looking for applicants who can start a summer internship as early as April 27th and work 40 hours per week, as well as those who can start a fall internship by August 31st and work 15-20 hours per week for the remainder of the year. The District may extend the summer positions into the fall semester with the expectation that these hires would also work 15-20 hours per week. The starting pay range varies from $13-$15 per hour (based on qualifications and past work experience). Questions should be directed to Blake Buehler at blake@cuwcd.com.
